

Notion Side-Hustle OS

A Notion workspace template that runs your side hustle on autopilot — projects, customers, finance, content, ideas, all linked.

Price: \$29

Sales blurb:

Most "Notion templates" are pretty dashboards that fall apart in week 3. This one is built around the actual workflow of running a side business while employed full-time: leads come in → projects get done → invoices go out → customers stay tracked → content keeps shipping. 8 connected databases, no fluff.

3-bullet description: - 8 linked databases — Leads, Projects, Customers, Invoices, Content, Ideas, Goals, Reviews - Designed for ~5 hours/week of upkeep, not 5 hours/day - Markdown source — import to Notion in 60 seconds

How to import to Notion

1. Open Notion → New page → ... menu → Import → Markdown.
 2. Upload this file. Notion will create one page; manually drag sub-sections into a database when you want database functionality.
 3. Or: paste each section below into a new database manually using the property schemas.
-

Database 1: Leads

Purpose: Track everyone who showed any interest. Most won't convert. That's fine.

Properties: - Name (Title) - Source (Select: TikTok / Twitter / LinkedIn / Cold email / Referral / Other) - Pain (Text — what problem are they trying to solve) - Status (Select: New / Contacted / In Convo / Proposal Sent / Won / Lost / Ghosted) - Last Touch (Date) - Next Action (Text) - Estimated Value (Number, \$) - Notes (Text)

View 1: Kanban grouped by Status. **View 2:** Table sorted by Last Touch ascending — surfaces leads going cold.

Database 2: Projects

Purpose: Active work that has a deliverable and a deadline.

Properties: - Project (Title) - Customer (Relation → Customers DB) - Status (Select: Not Started / In Progress / Awaiting Feedback / Done / Cancelled) - Deadline (Date) - Hours Logged (Number) - Hours Estimated (Number) - Burn (Formula: Hours Logged / Hours Estimated) - Deliverable (Files / URL) - Invoice (Relation → Invoices DB)

View 1: Board grouped by Status. **View 2:** Calendar by Deadline. **View 3:** Table filtered to Burn > 0.8 (over budget warning).

Database 3: Customers

Purpose: Past + current paying customers. Source of testimonials, repeat sales, and referrals.

Properties: - Name (Title) - Email (Email) - First Purchase (Date) - Total Spent (Rollup of Invoices DB → Sum) - Last Interaction (Date) - NPS (Number 0–10) - Tags (Multi-select: Repeat / High-value / Referral source / At-risk) - Testimonial (Text)

View 1: Table sorted by Total Spent descending. **View 2:** Filter where Last Interaction < 90 days ago AND NPS >= 8 — referral-ready list.

Database 4: Invoices

Properties: - Invoice # (Title — autoincrement manually, e.g. INV-001) - Customer (Relation → Customers) - Amount (Number, \$) - Issued (Date) - Due (Date) - Paid (Checkbox) - Paid On (Date) - Project (Relation → Projects)

View 1: Filter Paid = unchecked, sorted by Due ascending — outstanding invoices. **View 2:** Filter by month — monthly revenue view.

Database 5: Content Pipeline

Purpose: Every piece of content from idea to published.

Properties: - Title (Title) - Format (Select: TikTok / Twitter / LinkedIn / Newsletter / Blog / YouTube / Reel) - Status (Select: Idea / Drafting / Scheduled / Published / Archived) - Publish Date (Date) - Hook (Text) - CTA (Text) - URL (URL — fill in after publishing) - Performance (Select: Bombed / OK / Good / Hit)

View 1: Calendar by Publish Date. **View 2:** Filter by Status = Idea — backlog to draft from. **View 3:** Filter by Performance = Hit — patterns to copy.

Database 6: Ideas

Purpose: Capture without committing. Most ideas die here. That's the point.

Properties: - Idea (Title) - Type (Select: Product / Content / Marketing / Operations / Other) - Heat (Select: Cold / Warm / Hot — how excited am I now) - Captured (Date) - Notes (Text)

View 1: Filter Heat = Hot — pull these to Projects when you have capacity. **View 2:** Filter Captured > 6 months ago AND Heat = Cold — archive in bulk.

Database 7: Goals (Quarterly)

Properties: - Goal (Title) - Quarter (Select: Q1 / Q2 / Q3 / Q4) - Year (Number) - Type (Select: Revenue / Customer / Product / Skill / Personal) - Target (Number or Text) - Status (Select: On Track / At Risk / Off Track / Hit / Missed) - Notes (Text)

Use: Set 3–5 per quarter. No more. Review weekly in 5 min.

Database 8: Weekly Review

Properties: - Week of (Date — Monday) - Hours Worked (Number) - Revenue Earned (Number, \$) - New Leads (Number) - New Customers (Number) - Content Shipped (Number) - Wins (Text) - Lessons (Text) - Next Week Focus (Text)

Use: Friday evening, 15 minutes. Honest entries beat thorough ones.

How the OS works (the actual flow)

```
Idea → Ideas DB
  ↓ (if Heat = Hot)
Lead → Leads DB
  ↓ (if Won)
Project → Projects DB → Invoice → Invoices DB
  ↓ (if Paid)
Customer → Customers DB
  ↓ (every Friday)
Weekly Review → Reflect → Adjust Goals
```

Setup checklist

- [] Create the 8 databases in Notion using the schemas above
- [] Set up the relations (Projects ↔ Customers, Projects ↔ Invoices, Invoices ↔ Customers)
- [] Add the formula for Burn in Projects
- [] Add the rollup for Total Spent in Customers
- [] Pin the Weekly Review template to your sidebar
- [] First weekly review: this Friday, 15 minutes

What this OS is NOT

- An accounting system (Quickbooks/Wave still required for taxes)
- A CRM with email tracking (use Mailerlite/ConvertKit)
- A project management tool for teams (this is solo)
